

TLS timing breakdown: large GTLS costs come from per-period GPU dispatch loops

ZTF-like: 219,127 periods

Rubin-like: 313,007 periods

Same retained source and full supplied period grid within each panel. A40; one process per method.

Stacks: synchronized wall-phase profiles (1 GTLS / 2 v1 calls). Diamonds: 3 ordinary warm calls.

Batched GTLS variants change Python array operations only; returned spectra are compared separately.
