

Faster transit searches across TESS and ZTF cadences

Search time per lightcurve · lower is faster

○ One lightcurve ● Batch of 16: time per lightcurve
BLS / TESS: one dense sector

TLS / TESS: one dense sector

BLS / TESS: two separated sectors

TLS / TESS: two separated sectors

BLS / ZTF: sparse g/r

TLS / ZTF: sparse g/r

Labels give batch time and the time ratio to v1. Medians of 5 single / 3 batch calls; whiskers span repetitions. Logarithmic axes.
A40 + 7.65 CPU-equivalent allocation. Warm searches from prepared arrays; grid construction and preprocessing excluded.
Recovery qualifications are in the benchmark report. Equivalent TLS detection sensitivity is not established.
